Volunteer Bias

Definition

Volunteer Bias

Definition

A volunteer sample provides a biased estimate of the treatment effect in a population.

Volunteer Bias

Definition

A volunteer sample provides a biased estimate of the treatment effect in a population.

- Most program evaluations depend on all-volunteer samples, usually early adopters.

My Reasons

Why you should care

Why Volunteer Bias?

Why Volunteer Bias?

My Reasons

Why Volunteer Bias?

My Reasons

- Pervasive problem without a solution or advocate.

Why Volunteer Bias?

My Reasons

- Pervasive problem without a solution or advocate.
- Widely applicable: energy, medicine, education, etc.

Why Volunteer Bias?

My Reasons

- Pervasive problem without a solution or advocate.
- Widely applicable: energy, medicine, education, etc.
- Subtle problem that many won't recognize.

Why Volunteer Bias?

My Reasons

- Pervasive problem without a solution or advocate.
- Widely applicable: energy, medicine, education, etc.
- Subtle problem that many won't recognize.
- Deceptive, allowing the public to be fleeced.
 - (this really annoys me)

Effect on you

Effect on you

Researchers

- Exacerbates the challenge of recruitment in your behavioral studies.

Decision-Makers

Effect on you

Researchers

- Exacerbates the challenge of recruitment in your behavioral studies.

Decision-Makers

- Cost-benefit estimates will be skewed toward favorability.

Effect on you

Researchers

- Exacerbates the challenge of recruitment in your behavioral studies.

Decision-Makers

- Cost-benefit estimates will be skewed toward favorability.
- Unwarranted inferences from studies with biased samples can waste money and delay the discovery of effective alternatives.

Effect on you

Researchers

- Exacerbates the challenge of recruitment in your behavioral studies.

Decision-Makers

- Cost-benefit estimates will be skewed toward favorability.
- Unwarranted inferences from studies with biased samples can waste money and delay the discovery of effective alternatives.
- PUC, DOE, and Utility may endorse, subsidise, or provide energy efficiency programs and technologies that are ineffective.

Example: In-Home Displays

Example: In-Home Displays

Example: In-Home Displays

- Primary Goal: Reduce overall household energy consumption.

Example: In-Home Displays

- Primary Goal: Reduce overall household energy consumption.
- Secondary Goal: Promote learning about causes of use.

Survey

Survey

we conducted a survey

Prediction Task

Prediction Task

Your Prediction

Prediction Task

Your Prediction

“You have been chosen to receive a free in-home display. On the display you can see your home electricity use for one year. You will evaluate the display for 1 year. At the end of the year, you can keep it if you like it or return it for a \$25 gift certificate. We will send you four short surveys (one every 3 months) over the year asking how useful you find the display and about your electricity use. If you choose to participate, you will receive the display 3 weeks from now. There will be no cost to you and your information and survey responses will be confidential, as is university policy.”

Yes or No?

No

Items Generated from Mental Models Interviews

Will items generated from mental models interviews predict?

- “I would participate to promote energy independence in the US.”
- “I would participate to avoid wasting energy.”

Yes or No?

No

These predicted acceptance of smart-meters well, but not volunteering intentions.

Evaluation of Inputs

- we took stuff from previous propensity models in this area; we took stuff from volunteering literatures across various disciplines; we asked people in mental models; we brainstormed and use expert judgment; the hit rate was low
- talk about how unintuitive this stuff is; even for the person making the decision, they have difficulty with insight into what makes them work
- even when we ask people in mental models, they can't figure it out
- we can't rely on expert judgment, people's own theories, etc.

Accuracy

Classification Tree

- 5/72 items used in the model.
 - Expected enjoyment of the in-home display.
 - In the home from 6am-10am.
 - Whether they trust scientists.
 - Whether they trust friends.
 - Whether they handle unexpected problems well.

Accuracy

Classification Tree

- 5/72 items used in the model.
 - Expected enjoyment of the in-home display.
 - In the home from 6am-10am.
 - Whether they trust scientists.
 - Whether they trust friends.
 - Whether they handle unexpected problems well.
- 10-13% generalization error.

Recruiting non-volunteers

Recruiting non-volunteers

Recruiting non-volunteers

Recruiting non-volunteers

Recruiting non-volunteers

- All participants receive a 5-item survey with their recruitment offer.

Recruiting non-volunteers

Recruiting non-volunteers

- All participants receive a 5-item survey with their recruitment offer.
- Send two postcard follow-ups with at most 5 items.

Recruiting non-volunteers

Recruiting non-volunteers

- All participants receive a 5-item survey with their recruitment offer.
- Send two postcard follow-ups with at most 5 items.
- Sample non-responders for interviews.¹⁶

Summary

Checklist

Item

| Yes

|| No

Checklist

Item	Yes	No
<u>Recruitment</u>		
Have recruitment best practices been used?		
Has opt-out been used?		
Have 2 follow-up post-cards/letters been used?		
Do these postcards include 1-5 questions about non-response?		
Has a small up-front incentive (\$2) been used?		

Checklist

Item	Yes	No
<u>Recruitment</u>		
Have recruitment best practices been used?		
Has opt-out been used?		
Have 2 follow-up post-cards/letters been used?		
Do these postcards include 1-5 questions about non-response?		
Has a small up-front incentive (\$2) been used?		
<u>Inputs</u>		
Have inputs been derived from volunteering research in general?		
Do inputs include constraints, topical interest, expected benefit, and exploratory personality?		
Do inputs include lay theories about volunteering in this context?		

Checklist

Future Directions

Modern estimation alternative: Semi-supervised learning

- Simple example: Self-training²⁴
 - 1 Estimate average treatment effect (ATE) based on predictors of volunteering.

²⁴Zhu, X. and Goldberg, A. (2009). *Introduction to semi-supervised learning*. Morgan & Claypool Publishers

Future Directions

Modern estimation alternative: Semi-supervised learning

- Simple example: Self-training²⁴
 - 1 Estimate average treatment effect (ATE) based on predictors of volunteering.
 - 2 Find nearest match among non-volunteers in the control and treatment group.

²⁴Zhu, X. and Goldberg, A. (2009). *Introduction to semi-supervised learning*. Morgan & Claypool Publishers

Future Directions

Modern estimation alternative: Semi-supervised learning

- Simple example: Self-training²⁴
 - 1 Estimate average treatment effect (ATE) based on predictors of volunteering.
 - 2 Find nearest match among non-volunteers in the control and treatment group.
 - 3 Add this participant with the estimate from the ATE model.

²⁴Zhu, X. and Goldberg, A. (2009). *Introduction to semi-supervised learning*. Morgan & Claypool Publishers

Future Directions

Modern estimation alternative: Semi-supervised learning

- Simple example: Self-training²⁴
 - 1 Estimate average treatment effect (ATE) based on predictors of volunteering.
 - 2 Find nearest match among non-volunteers in the control and treatment group.
 - 3 Add this participant with the estimate from the ATE model.
 - 4 Repeat until treatment effect is estimated for all non-volunteers.

²⁴Zhu, X. and Goldberg, A. (2009). *Introduction to semi-supervised learning*. Morgan & Claypool Publishers

Future Directions

Future Directions

Conducting a real trial

Future Directions

Conducting a real trial

- The approach needs to be validated with real data.

Future Directions

Conducting a real trial

- The approach needs to be validated with real data.
- The approach has the potential to greatly improve the validity of any behavioral trial.
